honeycomb lung refers to the fibrotic cystic changes seen in the lungs of those with certain diseases. This condition is often associated with chronic lung diseases such as idiopathic pulmonary fibrosis or idiopathic pulmonary hemosiderosis. Understanding the prevalence of honeycomb lung is crucial for healthcare professionals to diagnose and manage these conditions effectively.

Food allergies can occur for a variety of reasons, but a food allergy is caused by a specific immune response to a substance that is typically harmless to most people. This immune response is triggered by exposure to that substance, leading to symptoms such as skin irritation, digestive issues, or respiratory problems.

The 11th world congress and expo on immunology will be organized around the theme of translating basic immunological discoveries into clinically useful tools. This event aims to bring together experts to discuss advances in immunology and their potential applications. The conference will attract researchers, clinicians, and policymakers to explore and share new insights.
