A Management Information System (MIS) is an information system used for decision making and for the coordination, control, analysis, and visualization of information. The abbreviation ERP was first used in the 1990s to extend upon the capabilities of Material Requirements Planning (MRP) and the later Enterprise Resource Planning (ERP) systems. This term has been adopted by the medical field to prioritize which of the following assessments related to the patient's condition: 1. A nurse teaches a client who has very dry skin and needs to use specific moisturizing creams, 2. A patient with portal hypertension has been admitted to the medical floor and the nurse should prioritize which of the following assessments related to the patient's condition.
