Bovine tuberculosis is a widespread concern about tuberculosis becoming resistant to antibiotics. The World Health Organization (WHO) says during the 18th and 19th centuries, tuberculosis was widespread, particularly in Europe and North America. It reached epidemic proportions in those regions.

The World Health Organization (WHO) says tuberculosis, which is caused by the bacterium Mycobacterium tuberculosis, is a contagious infectious disease that primarily affects the lungs. People with the germ can pass it on to others through coughing, sneezing, or speaking.

Tuberculosis is a highly infectious disease that primarily affects the lungs. According to the World Health Organization (WHO), 10 percent of the world's population is infected with tuberculosis. In 2008, nearly one-third of the world's population was infected with tuberculosis.

The Stop TB Partnership aims to push tuberculosis up the world political agenda and focuses on expanding the use of the Stop TB strategy. Since its inception, the Stop TB Partnership has sought to bring about a world free of tuberculosis.

The Stop TB Partnership has supported the development of tools and strategies to address tuberculosis, including the Stop TB Strategy, which prioritizes the most effective and cost-effective interventions.

The Stop TB Partnership has also supported the development of the Global Plan for TB Control, which is a strategic framework for tuberculosis control at the national level. The Plan provides a road map for action by countries, donors, and other stakeholders.
